

FICTIONAL EXAMPLE PROTOCOL - FOR SOFTWARE DEMONSTRATION ONLY

Protocol ZLV-301, Amendment 2 (Version 3.0), 15 January 2026.

A Phase III, Randomized, Double-blind, Placebo-controlled Study of Zelvatinib in Adults with Moderate-to-Severe Plaque Psoriasis.

Zelvatinib, the sponsor and all study details are invented. This document is not a real protocol.

Primary endpoint: proportion of subjects achieving PASI 75 at Week 12. The Week 12 PASI assessment is the primary efficacy assessment.

6. Study Population

6.1 Inclusion criteria: adults 18 to 75 years; plaque psoriasis for at least 6 months; PASI of 12 or more and body surface area of 10% or more at baseline.

6.2 Exclusion criteria: ALT or AST greater than 2 times the upper limit of normal at screening; active tuberculosis; live vaccine within 4 weeks before randomization.

Subjects who do not meet all eligibility criteria must not be randomized. Randomization of an ineligible subject is an important protocol deviation.

7. Study Drug

7.2 Storage: Zelvatinib tablets must be stored at 15 to 25 C. Any temperature excursion must be reported to the sponsor within 1 business day, and affected kits must be quarantined and not dispensed until the sponsor approves their use.

7.4 Dose interruption: study drug must be interrupted if ALT or AST rises above 3 times the upper limit of normal, and must not be restarted without medical monitor approval.

7.5 Compliance: returned tablets must be counted at every dispensing visit.

8. Schedule of Assessments

8.1 Visit windows: visits from Week 2 to Week 12 must occur within plus or minus 3 days of the scheduled day; visits from Week 16 onward within plus or minus 7 days.

A visit outside its window is a protocol deviation. A missed Week 12 PASI assessment is an important protocol deviation.

10. Safety Reporting

10.1 Disease flares: worsening of psoriasis is recorded as an adverse event only if it is more severe than the subject's usual fluctuation, and is not a serious adverse event unless it meets a seriousness criterion.

10.2 Hospitalizations: a hospitalization for an elective procedure that was planned before the subject signed the informed consent form is not a serious adverse event.

10.3 Reporting: all serious adverse events must be reported to the sponsor within 2 business days of the site becoming aware of the event. Reporting later than this is an important protocol deviation.

10.4 Pregnancy: any pregnancy in a subject must be reported to the sponsor within 24 hours of the site becoming aware of it.

12. Protocol Deviations

Important protocol deviations include: randomization of an ineligible subject; study procedures before informed consent; late reporting of a serious adverse event; dispensing of quarantined study drug; missed Week 12 PASI assessment.
